Notes:
[1] Standard Errors assume that the covariance matrix of the errors is correctly specified.
[2] The condition number is large, 4.6e+03. This might indicate that there are
strong multicollinearity or other numerical problems.

4

a

It means that there is a risk of investors not believing the Fed in the upcoming months, and that could make monetary policy less effective. This comes from the Fed's response to investors, where they explained that they are paying attention to the market and the incoming data to implement their policies.

b

Stock prices will increase.

5

The alternative explanation is that the recession threats have receeded due to the economy's capacity to recover from external shocks.
